>>>

1

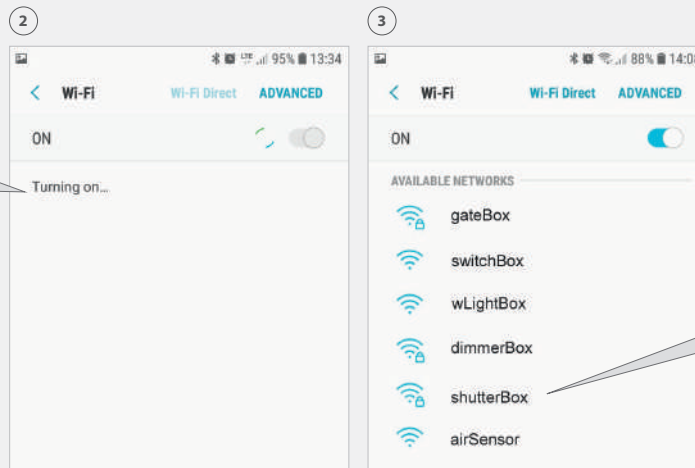

Press to connect to WiFi network

Make sure that mobile data are OFF

2

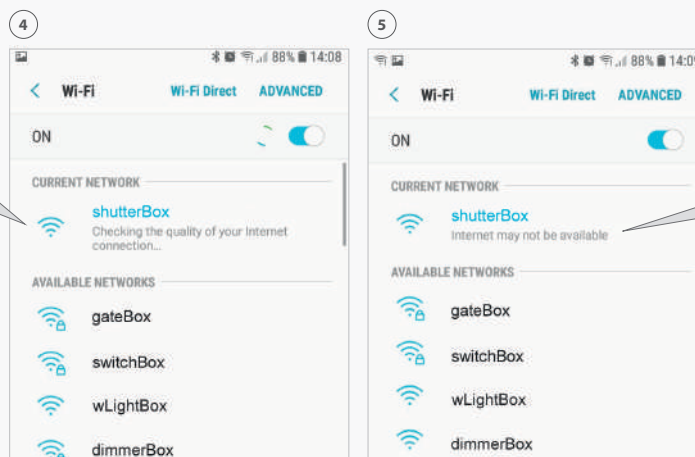

Wait till network scan ends

Choose the controller WiFi network

3

Wait until connected...

Connected! Some phones may report that „Internet may not be available“ - it's normal

6

Once you open the wBox app, You will see the „Directly connected devices“ section

Press the „+“ button to add the device to your wBox app

By the circle button you can directly control the device and see its state!

Finally press on the device name to move forward...

7

This part of the screen displays the device current state

Press the „gearwheel“ button to move to the device settings

Here are control buttons

1

In this box you can change the device name, eg. „Shutters in kitchen“

This box should be set to „Yes“ if you wish to be able to control the devices outside from your home

8

Move on...

2

Move on to the „Connect to WiFi“ section

Find your home WiFi network from the list; Highlight it by pressing on

9

Press „connect“ button

3

Type your WiFi network protection password

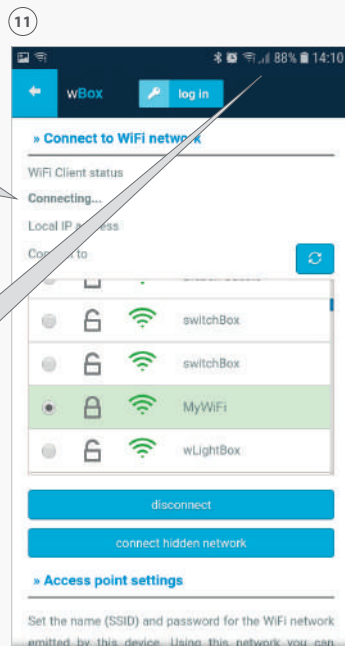

Press „connect“ button

10

4

Wait few seconds...

Notice:
when connecting the controller to the WiFi, the phone may temporarily lose the connection with the controller - this is a normal situation

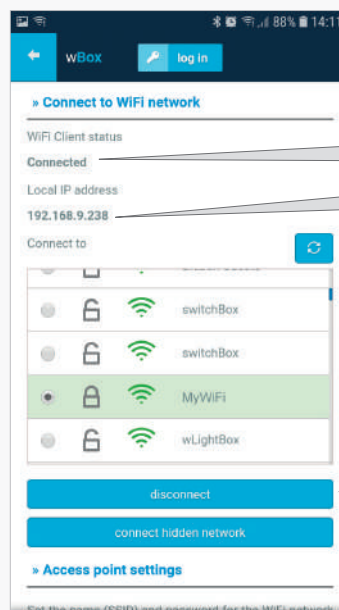

12

You should get the „Connected“ status

And the proper IP address

If you get an error under the status field, please press "disconnect" button and try to reconnect

Move on...

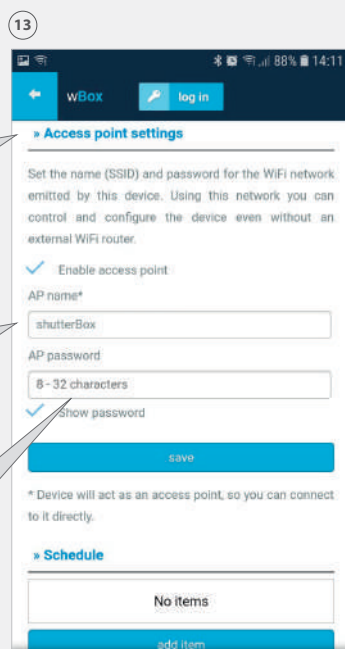

5

Move on to the „Access point“ section

Here you can change the name of the device AP

Set the password for the device AP to prevent unauthorized access!

14

Remember to click „save“ button

That's all!
More device-specific informations are available in the user-manuals
