

# Intelligent Auto-Tracking Function

The auto-tracking function is supplied with our 22X zoom network PTZ camera to empower your surveillance, and maximize the advantage of a PTZ camera. With this function, your environment is secured safely.

The camera will automatically lock and follow the largest movement in the monitoring view, making the camera pan (max. 360°), tilt (max. 90°) and zoom to keep the target in the center of the view within: (1) the camera's pre-defined surveillance area / (2) the pre-defined tracking timeout. When the locked target is out of the pre-defined surveillance area or stays in the same monitoring view longer than the pre-defined tracking timeout, the camera returns to the point it originally monitors. It's the best function to provide evidentiary recording.

Pre-defined Surveillance Range
