

TBA120S IF Amplifier and Detector

General Description

The TBA120S is a monolithic integrated circuit specifically designed for audio detection in TV and FM radio receivers. It incorporates an 8-stage limiting IF amplifier and balanced detector plus a DC operated volume control.

The TBA120S is supplied in four groups depending on the resistance required between pin 5 and ground to attenuate the audio output by 30 dB. The group number as defined below is marked on the package.

Group	II	III	IV	V	
R5-GND	1.9-2.2	2.1-2.5	2.4-2.9	2.8-3.3	kΩ

Pins 3 and 4 are connected to the collector and base of a transistor which may be used as an AF-preamplifier or as a switch.

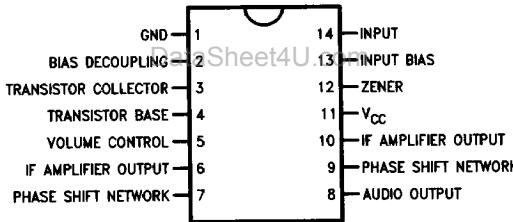

At pin 12 a zener-diode is accessible which can be used to stabilize the supply voltage of this integrated circuit or the voltage of other circuit elements in the set.

Features

- Electronic attenuator: replaces conventional AC volume control
- Volume reduction range 85 dB typ
- Sensitivity: 3 dB limiting voltage 30 μV typ
- Excellent AM rejection 68 dB typ at 10 mV
- Audio output voltage 1V typ
- Wide supply voltage range (6V-18V)
- Internal zener diode regulator
- Very low external component requirement
- Simple detector alignment: one coil
